1 INTRODUCTION

Toy safety is the practice of ensuring that toys, especially those made for children, are safe, usually through the application of set safety standards. In many countries, toys must be able to pass safety tests in order to be sold. Many regions model their safety standards on the EU's EN71 standard, either directly, or through adoption of the ISO8124 standard which in itself is modelled on EN71. In Europe, toys must meet the criteria set by the EC Toy Safety Directive (Council Directive 88/378/EEC). This directive has been superseded by Council Directive 2009/48/EC, which applies to toy imports into the EU since 20 July 2011. There is an exception for the chemical requirements under part III of Annex II of this directive. These chemical requirements became into force on 20 July 2013.

Part 3 of EN71:1994 (to be superseded by EN71-3:2013) describes the determination of migration of elements (metals that are considered hazardous) when a toy gets into contact with an acid solution (0.07 n HCl, simulating a gastric acid solution).

In this interlaboratory study on migration of certain elements 120 laboratories in 28 different countries have registered for participation. See appendix 3 for the number of participants per country. In this report, the results of the 2016 proficiency test are presented and discussed. This report is also electronically available through the iis website www.iisnl.com.

2 SET UP

The Institute for Interlaboratory Studies in Spijkenisse, the Netherlands, was the organiser of this proficiency test (PT). Sample analyses for fit-for-use and homogeneity testing were subcontracted to an ISO17025 accredited laboratory. It was decided to prepare three different samples with different concentrations of metals for evaluation in the PT. The first sample was a plaster to which Arsenic, Chromium, Copper and Lead were added. The second sample was a paper sample to which arsenic was added. The third sample was a dried paint spiked with the metals Antimony, Cadmium, Chromium, and Lead. The three materials contained a combination of elements mentioned in the 'new' Council Directive 2009/48/EC under categories 1 and 3. The participants were requested to report rounded and unrounded test results. The unrounded test results were preferably used for statistical evaluation.

2.1 ACCREDITATION

The Institute for Interlaboratory Studies in Spijkenisse, the Netherlands, is accredited in agreement with ISO/IEC 17043:2010 (R007), since January 2000, by the Dutch Accreditation Council (Raad voor Accreditatie). This ensures strict adherence to protocols for sample preparation and statistical evaluation and 100% confidentiality of participant's data. Feedback from the participants on the reported data is encouraged and customer's satisfaction is measured on regular basis by sending out questionnaires.

2.2 PROTOCOL

The protocol followed in the organisation of this proficiency test was the one as described for proficiency testing in the report 'iis Interlaboratory Studies: Protocol for the Organization, Statistics and Evaluation' of April 2014 (iis-protocol, version 3.3). This protocol can be downloaded from the iis website www.iisnl.com, from the FAQ page.

2.3 CONFIDENTIALITY STATEMENT

All data presented in this report must be regarded as confidential and for use by the participating companies only. Disclosure of the information in this report is only allowed by means of the entire report. Use of the contents of this report for third parties is only allowed by written permission of the Institute for Interlaboratory Studies. Disclosure of the identity of one or more of the participating companies will be done only after receipt of a written agreement of the companies involved.

2.4 SAMPLES

Three batches with three different matrices and containing a number of different elements were prepared. One batch was a plaster (= cat. 1), the second batch a paper sample (=cat. 3) and the third was a scraped-off dried paint (=cat. 3), all prepared by iis.

To the batch of plaster (used for sample #16555) the elements Arsenic, Chromium, Copper and Lead were added via several intermediate steps. After thorough mixing/homogenizing, the batch of plaster was divided over 160 plastic bags, each filled with 0.5 grams and labelled #16555. The homogeneity of the subsamples was verified by measuring the total element content on 8 stratified randomly selected samples. The results varied for Arsenic between 5 - 7 mg/kg, for Chromium between 22160 - 26950 mg/kg, for Copper between 1236 - 1455 mg/kg and for Lead between 70 - 77 mg/kg. The differences between the test results for homogeneity of the subsamples #16555 were all well within the precision of the laboratory and therefore the homogeneity of the subsamples #16555 was assumed.

A batch of paper was printed both sides with ink, that was enriched with Arsenic. After thorough mixing/homogenizing of the ink, it was used to print 75 sheets of paper. After drying, the sheets of paper were cut into pieces that were divided into 160 plastic bags each and labelled #16555. The homogeneity of the subsamples was verified by measuring Arsenic after migration according to EN71-3. The migration test results for Arsenic varied between 7.8 – 8.4 mg/kg. The differences between the test results for homogeneity of the subsamples #16556 were well within the precision of the laboratory and therefore the homogeneity of the subsamples #16556 was assumed.

A batch of liquid paint (to be used for sample #16557) was enriched with the elements Antimony, Cadmium, Chromium, and Lead. After application to a surface, drying, scraping off, milling, sieving and homogenization, a total of 160 samples of 0.5 gram were prepared and labelled #16557. The homogeneity of the subsamples #16557 was verified by measuring the total element content on 8 stratified randomly selected samples. The results varied for Antimony between 700 - 776 mg/kg, for Chromium between 752 - 835 mg/kg, Cadmium between 263 - 291 mg/kg and for Lead between 377 - 411 mg/kg.

The differences between the test results for homogeneity of the subsamples #16557 were all well within the precision of the laboratory and therefore the homogeneity of the subsamples #16557 was assumed.

One plastic bag with 0.5 gram of plaster (#16555), one plastic bag with 1.0 gram of printed paper (#16556) and one plastic bag with 0.5 gram of scraped-off dried paint (#16557) were sent to the participating laboratories on April 6, 2016.

2.5 ANALYSES

The participants were requested to determine the migration of elements applying the analysis procedure that is routinely used in the laboratory. To get comparable test results, a detailed report form, on which the analytes and the units were prescribed as well as the reference test method, and a letter of instructions were prepared. Both were made available on the data entry portal www.kpmd.co.uk/sgs-iis-cts/. A form to confirm receipt of the sample and a letter of instructions were added to the sample package.

3 RESULTS

During five weeks after sample dispatch, the test results of the individual laboratories were gathered via the data entry portal www.kpmd.co.uk/sgs-iis-cts/. The reported test results are tabulated per determination in appendix 1 of this report. The laboratories are presented by their code numbers.

Directly after the deadline, a reminder was sent to those laboratories that had not reported test results at that moment. Shortly after the deadline, the available test results were screened for suspect data. A test result was called suspect in case the Huber Elimination Rule (a robust outlier test) found it to be an outlier. The laboratories that produced these suspect data were asked to check the reported test results (no reanalysis). Additional or corrected test results are used for data analysis and the original reported test results placed under 'Remarks' in the result tables in appendix 1. Test results that came in after the deadline were not taken into account in this screening for suspect data and thus these participants were not requested for checks.

A list of abbreviations used in the tables can be found in appendix 3.

3.1 STATISTICS

Statistical calculations were performed as described in the report 'iis Interlaboratory Studies: Protocol for the Organisation, Statistics and Evaluation' of April 2014 (iis-protocol, version 3.3) For the statistical evaluation the *unrounded* (when available) figures were used instead of the rounded results. Results reported as '<...' or '>...' were not used in the statistical evaluation.

First, the normality of the distribution of the various data sets per determination was checked by means of the Lilliefors-test a variant of the Kolmogorov-Smirnov test and by the calculation of skewness and kurtosis. Evaluation of the three normality indicators in combination with the visual evaluation of the graphic Kernel density plot, lead to judgement of the normality being either 'unknown', 'OK', 'suspect' or 'not OK'. After removal of outliers, this check was repeated. Not all data sets proved to have a normal distribution, in which cases the statistical evaluation of the results should be used with due care.

In accordance to ISO 5725 the original test results per determination were submitted subsequently to Dixon's and Grubbs' and/or Rosner's outlier tests. Outliers are marked by D(0.01) for the Dixon's test, by G(0.01) or DG(0.01) for the Grubbs' test and by R(0.01) for the Rosner's test. Stragglers are marked by D(0.05) for the Dixon's test, by G(0.05) or DG(0.05) for the Grubbs' test and by R(0.05) for the Rosner's test. Both outliers and stragglers were not included in the calculations of the averages and the standard deviations.

For each assigned value the uncertainty was determined in accordance with ISO13528. Subsequently the calculated uncertainty was evaluated against the respective requirement based on the target reproducibility in accordance with ISO13528. When the uncertainty passed the evaluation no remarks are made in the report. However, when the uncertainty failed the evaluation it is mentioned in the report and it will have consequences for the evaluation of the test results.

Finally, the reproducibilities were calculated from the standard deviations by multiplying them with a factor of 2.8.

3.2 GRAPHICS

In order to visualise the data against the reproducibilities from literature, Gauss plots were made, using the sorted data for one determination (see appendix 1). On the Y-axis the reported analysis results are plotted. The corresponding laboratory numbers are under the X-axis.

The straight horizontal line presents the consensus value (a trimmed mean). The four striped lines, parallel to the consensus value line, are the +3s, +2s, -2s and -3s target reproducibility limits of the selected reference test method. Outliers and other data, which were excluded from the calculations, are represented as a cross. Accepted data are represented as a triangle.

Furthermore, Kernel Density Graphs were made. The Kernel Density Graph is a method for producing a smooth density approximation to a set of data that avoids some problems associated with histograms. Also a normal Gauss curve was projected over the Kernel Density Graph for reference.

3.3 Z-SCORES

To evaluate the performance of the individual participating laboratories the z-scores were calculated. In order to be able to have an objective evaluation of the performance of the individual participants, it was decided to evaluate this performance against the literature requirements. Therefore, the z-scores were calculated using a target standard deviation.

To validate the concept test method as laid down in EN71-3:2013, an interlaboratory study (ILS) was organized by the Netherlands Food and Consumer Product Safety Authority (NVWA) in 2012. The results from this ILS were evaluated by Quodata (see appendix 3, no.16). The RSD_R, calculated in this report via method III (after robust elimination of outlier laboratories and using methods according to ISO5725) were used as target standard deviations.

When a laboratory did use a test method with a reproducibility that is significantly different from the reproducibility of the reference test method used in this report, it is strongly advised to recalculate the z-score, while using the reproducibility of the actual test method used, this in order to evaluate the fit-for-useness of the reported test result.

The $z_{(target)}$ -scores were calculated according to:

$$z_{(target)} = (\text{individual test result} - \text{average of proficiency test}) / \text{target standard deviation}$$

The $z_{(target)}$ -scores are listed in the result tables in appendix 1.

Absolute values for $z < 2$ are very common and absolute values for $z > 3$ are very rare. The usual interpretation of z-scores is as follows:

- $|z| < 1$ good
- $1 < |z| < 2$ satisfactory
- $2 < |z| < 3$ questionable
- $3 < |z|$ unsatisfactory

4 EVALUATION

During the execution of this proficiency test no problems were encountered. From the 120 participants, only two participants reported results after the deadline for reporting and two participants did not report any test results at all. Finally, the 118 reporting laboratories submitted 2043 numerical results. Observed were 32 outlying results, which is 2.5%. In proficiency studies outlier percentages of 3% - 7.5% are quite normal.

Not all original data sets proved to have a normal Gaussian distribution. These are referred to as "not OK" or "suspect". The statistical evaluation of these data sets should be used with due care, see also paragraph 3.1.

For the dried paint sample (#16557) multimodal distributions were found for aluminium, cadmium, chromium, lead and strontium. Since the sample was enriched with cadmium, chromium and lead, in order to give significant migration levels of these elements, and given the proven fact that the elements were homogeneously divided over the sample material, it was clear that the lower test results were suspect. In order to have a good estimate of the migration level of these elements, the lower test results of the group of laboratories were excluded from the statistical evaluation of these elements.

4.1 EVALUATION PER SAMPLE AND PER ELEMENT

In this section, the determination is discussed. All statistical results reported on the samples are summarised in appendix 1.

PLASTER Sample #16555

Aluminium: The migration of aluminium from plaster on sample #16555 at a level of 287 mg/kg may not be problematic. Four statistical outliers were observed. However, the calculated reproducibility after rejection of the statistical outliers is in good agreement with the target reproducibility based on the data in report "Statistical evaluation of results from round robin on EN71-3:13", ref. 16.

Arsenic: The migration of arsenic from plaster on sample #16555 at a level of 4.1 mg/kg may not be problematic. No statistical outliers were observed. The calculated reproducibility is in good agreement with the target reproducibility based on the data in report "Statistical evaluation of results from round robin on EN71-3:13", ref. 16.

- Chromium: The migration of chromium from plaster on sample #16555 at a level of 10.5 mg/kg may be problematic. Seven statistical outliers were observed. The calculated reproducibility after rejection of the statistical outliers is not in agreement with the target reproducibility based on the data in report "Statistical evaluation of results from round robin on EN71-3:13", ref. 16.
- Copper: The migration of copper from plaster on sample #16555 at a level of 1550 mg/kg may not be problematic. Three statistical outliers were observed. However, the calculated reproducibility after rejection of the statistical outliers is in good agreement with the target reproducibility based on the data in report "Statistical evaluation of results from round robin on EN71-3:13", ref. 16.
- Lead: The migration of lead from plaster on sample #16555 at a level of 52 mg/kg may not be problematic. No statistical outliers were observed. The calculated reproducibility is in good agreement with the target reproducibility based on the data in report "Statistical evaluation of results from round robin on EN71-3:13", ref. 16.
- Manganese: The migration of manganese from plaster on sample #16555, at a level of 62 mg/kg may be problematic. Only one statistical outlier was observed. The calculated reproducibility after rejection of the statistical outlier is not in agreement with the target reproducibility based on the data in report "Statistical evaluation of results from round robin on EN71-3:13", ref. 16.
- Strontium: The migration of strontium from plaster on sample #16555, at a level of 306 mg/kg may be problematic for a number of laboratories. Seven statistical outliers were observed. However, the calculated reproducibility after rejection of the statistical outliers is in good agreement with the target reproducibility based on the data in report "Statistical evaluation of results from round robin on EN71-3:13", ref. 16.

PAPER Sample #16556:

- Arsenic: The migration of arsenic from paper on sample #16556 at a level of 7 mg/kg may not be problematic. Two statistical outliers were observed. However, the calculated reproducibility after rejection of the statistical outliers is in good agreement with the target reproducibility based on the data in report "Statistical evaluation of results from round robin on EN71-3:13", ref. 16.

DRIED PAINT Sample #16557:

- Aluminium: A bimodal distribution of the data was found. The test results of the group of laboratories with lower values (19%) were excluded. The migration of aluminium from dried paint on sample #16557 at a level of 3645 mg/kg may not be problematic. One statistical outlier was observed and twenty other test results were excluded. However, the calculated reproducibility after rejection of the suspect data is in good agreement with the target reproducibility based on the data in report "Statistical evaluation of results from round robin on EN71-3:13", ref. 16.

When the lower test results are not excluded, the observed dispersion is still in agreement with the target reproducibility based on the data in report "Statistical evaluation of results from round robin on EN71-3:13", ref. 16.

Antimony:

The migration of antimony from dried paint on sample #16557 at a level of 181 mg/kg may not be problematic. Three statistical outliers were observed. However, the calculated reproducibility after rejection of the statistical outliers is in good agreement with the target reproducibility based on the data in report "Statistical evaluation of results from round robin on EN71-3:13", ref. 16.

Cadmium:

A multimodal distribution of the data was found. The test results of the group with lower values (10%) were excluded. The migration of cadmium from dried paint on sample #16557 at a level of 265 mg/kg may not be problematic. One statistical outlier was observed and twelve other test results were excluded. However, the calculated reproducibility after rejection of the suspect data is in good agreement with the target reproducibility based on the data in report "Statistical evaluation of results from round robin on EN71-3:13", ref. 16. When the lower test results are not excluded, the observed dispersion is still in agreement with the target reproducibility based on the data in report "Statistical evaluation of results from round robin on EN71-3:13", ref. 16.

Chromium:

A bimodal distribution of the data was found. The test results of the group with lower values (23%) were excluded. The migration of chromium from dried paint on sample #16557 at a level of 211 mg/kg may not be problematic. No statistical outliers were observed and twenty-five test results were excluded. However, the calculated reproducibility after rejection of the suspect data is in good agreement with the target reproducibility based on the data in report "Statistical evaluation of results from round robin on EN71-3:13", ref. 16. When the lower test results are not excluded, the observed dispersion is not at all in agreement with the target reproducibility based on the data in report "Statistical evaluation of results from round robin on EN71-3:13", ref. 16.

Lead:

A trimodal distribution of the data was found. The test results of the group with lower values (18%) were excluded. The migration of lead from dried paint on sample #16557 at a level of 318 mg/kg may not be problematic. One statistical outlier was observed and nineteen test results were excluded. However, the calculated reproducibility after rejection of the suspect data is in good agreement with the target reproducibility based on the data in report "Statistical evaluation of results from round robin on EN71-3:13", ref. 16. When the lower test results are not excluded, the observed dispersion is not at all in agreement with the target reproducibility based on the data in report "Statistical evaluation of results from round robin on EN71-3:13", ref. 16.

Manganese:

The migration of Manganese from dried paint on sample #16557 at a level of 11 mg/kg, may not be problematic. Two statistical outliers were observed. However, the calculated reproducibility, after rejection of the statistical outliers, is in good agreement with the target reproducibility based on the data in report "Statistical evaluation of results from round robin on EN71-3:13", ref. 16.

Strontium: A bimodal distribution of the data was found. The test results of the group with lower values (15%) were excluded. The migration of lead from dried paint on sample #16557 at a level of 151 mg/kg may not be problematic. No statistical outliers were observed, but sixteen results were excluded. However, the calculated reproducibility after rejection of the suspect data is in good agreement with the target reproducibility based on the data in report "Statistical evaluation of results from round robin on EN71-3:13", ref. 16. When the lower test results are not excluded, the observed dispersion is not in agreement with the target reproducibility based on the data in report "Statistical evaluation of results from round robin on EN71-3:13", ref. 16.

4.2 PERFORMANCE EVALUATION FOR THE GROUP OF LABORATORIES

A comparison has been made between the target reproducibilities based on the report "Statistical evaluation of results from round robin on EN71-3:13", ref. 16 and the reproducibilities as found for the group of participating laboratories. The number of significant results, the average results, the calculated reproducibilities (standard deviation*2.8) and the target reproducibilities (EN71-3:13) are compared in the next table.

Element	unit	n	average	2.8 * sd	R (target)
Aluminium	mg/kg	94	287	164	442
Arsenic	mg/kg	73	4.1	3.6	4.6
Chromium	mg/kg	86	10.5	12.8	6.8
Copper	mg/kg	98	1550	741	998
Lead	mg/kg	104	52.4	31.5	38.1
Manganese	mg/kg	99	62.3	27.2	21.3
Strontium	mg/kg	92	306	152	163

Table 1: reproducibilities of test results in plaster sample #16555

Element	unit	n	average	2.8 * sd	R (target)
Arsenic	mg/kg	97	7.0	3.9	8.8

Table 2: reproducibility of test results in paper sample #16556

Element	unit	n	average	2.8 * sd	R (target)
Aluminium	mg/kg	88	3638	1676	7029
Antimony	mg/kg	112	181	140	309
Cadmium	mg/kg	104	265	98	415
Chromium	mg/kg	88	211	97	171
Lead	mg/kg	93	319	166	196
Manganese	mg/kg	90	11.3	7.6	7.6
Strontium	mg/kg	96	151	57	68

Table 3: reproducibilities of test results in scraped off paint sample #16557

From the above table it can be concluded that, without statistical calculations, the group of participating laboratories has no difficulties with the determination of the migration of the evaluated elements in plaster and dried paint in accordance with EN71-3:2013 when compared

with the target reproducibilities based on the report "Statistical evaluation of results from round robin on EN71-3:13", ref. 16.

It is to be expected that the validation data of EN71-3 will improve and that smaller target reproducibilities will be published in due time.

4.3 COMPARISON OF THE PROFICIENCY TEST OF APRIL 2016 WITH PREVIOUS PTS

	<i>April 2016</i>	<i>April 2015</i>	<i>April 2014</i>	<i>April 2013</i>	<i>February 2012</i>	<i>March 2011</i>
Number of reporting labs	118	146	112	116	113	74
Number of results reported	2043	2099	1754	957	982	716
Statistical outliers	32	53	64	41	28	34
Percentage outliers	1.6%	2.5%	3.6%	4.3%	2.9%	4.4%

Table 4: comparison with previous proficiency tests

In proficiency tests, outlier percentages of 3% - 7.5% are quite normal.

The uncertainties determined in this PT are compared with the relative standard deviations as found in previous years and with the target requirements in the next tables:

<i>Element</i>	<i>April 2016</i>	<i>April 2015</i>	<i>April 2014</i>	<i>April 2013</i>	<i>Target*) category1</i>
Aluminium	20%	20%	21%	--	55%
Antimony	--	--	28%	--	39%
Arsenic	32%	--	--	--	40%
Barium	--	20%	--	--	29%
Boron	--	--	--	--	21%
Cadmium	--	--	--	--	45%
Chromium	44%	--	--	--	23%
Cobalt	--	--	--	--	16%

Tin	--	--	--	--	32-42%	--	--	32%
Organic Tin	--	--	--	--	--	--	--	39%
Zinc	--	--	13%	17%	11-39%	--	--	43%

Table 6: comparison of the uncertainties in the previous rounds and this PT for category 3 materials

*) From the report 'Statistical evaluation of results from round robin on EN71-3:13", ref. 16.

For the investigated elements the performance of the group is similar to previous years. The performance of the group is good in comparison with the precision requirements of EN71-3.

5 DISCUSSION

In order to find the cause of the problems observed with sample #16557 in the determination of aluminium, cadmium, chromium, lead and strontium, the participants were asked to give some details on the first steps of the migration, e.g. the amount of dried paint and the volume of the 0.07 mol/l HCl, the pH adjustment, the membrane filter, the filter time and the use of a centrifuge. About 87% of the laboratories did respond within a week, see appendix 2. Only 44% of the responding laboratories appeared to follow EN71-3 to the letter.

Ratio dried paint: 0.07 mol/l HCl

This ratio varied from 2.06 up to 30 (30.9 mg/15ml – 150 mg/5ml); 90% of the laboratories used a ratio of 20:1 as mentioned in EN71-3, but 10% of the laboratories used a deviating ratio.

Laboratory 2295 used only 20 mg of dried paint and 5 ml 0.07 mol/l HCl as per EN71-3, resulting in a ratio of 4:1. The influence of the deviating ratios on the element concentrations does not show to be not significant for the dried paint sample evaluated in this PT.

Membrane filter

About 70% of the laboratories used a 0.45µm membrane filter, while 16% used a 0.22µm membrane filter. Both filter types are mentioned to be suitable in EN71-3. The other laboratories used a wide variety of other filters not mentioned in EN71-3, see appendix 3.

No influence of the use of deviating filter types on the element concentrations is observed.

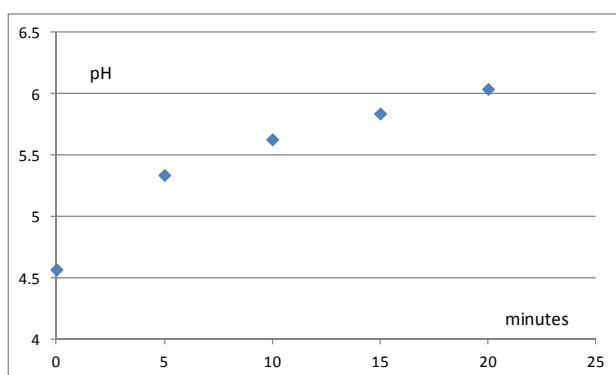

Centrifuge

Almost all laboratories (94%) did not use a centrifuge to remove remaining visible solid materials. Therefore no conclusions could be drawn about the use of a centrifuge.

pH adjustment

About 56% of the laboratories did adjust the pH after one minute shaking at 37°C, while 41% did not do that. A wide range of initial pH values (before adjustment) was reported: 1.2, 1.27, <1.3, 1.3, 2.5, 2.94 and 5.61. No less than 15 laboratories mentioned that the pH was adjusted before the shaking started and not after one minute of shaking at 37°C. The influence of the different acting of the laboratories on the element concentrations is visible.

To investigate the fact that very different initial pH values were reported, a small experiment was done. An amount of 250 mg dried paint sample #16557 was added to 12.5 ml 0.07 mol/l HCl at room temperature (approx 25°C). The blank pH was 1.25. After addition of the dried paint the mixture was not shaken, nor heated. The pH, immediately after addition of the dried paint was 4.57. It was measured again after 5 min., 10 min., 15 min. and 20 min., see graph:

After 20 min. the temperature was raised to 37°C. The final pH after 60 min. was 6.42 (!). No aluminium could be detected in this final solution with pH 6.42 after filtering through 0.45µm. The migration of elements of sample #16557 obviously consumes a significant amount of acid. Therefore it is clear that pH adjustment was necessary. However, many laboratories did not adjust the pH at all and several other laboratories did measure the pH at t = 0 min. and thus they may have added too little acid. In both cases the necessary excess of acid may not have been used. This will have caused aluminium to precipitate when pH>5. Other metals may have co-precipitated and the precipitate will have been removed during the filtering step. This may well explain the very low test results for aluminium, cadmium, chromium, lead and strontium as reported by a number of laboratories.

When the test results were evaluated of the 52 laboratories that reported to have followed EN71-3 to the letter and that reported to have adjusted the pH after one minute of shaking at 37°C, the following was found for the problematic elements:

Element	unit	n	average	2.8 * sd	R (target)
Aluminium	mg/kg	43	3636	1494	7024
Cadmium	mg/kg	50	263	94	413
Chromium	mg/kg	46	211	98	171
Lead	mg/kg	47	317	146	195
Strontium	mg/kg	48	141	67	66

Table 7: reproducibilities of selected test results in dried paint sample #16557

The results in above table 7 are very similar to the results found after exclusion of a selected group of laboratories that was used for the calculation of the z-scores and that is presented in table 3 of this report.

The migration capability does vary very much per element and per matrix. For example chromium hardly migrates from plaster, while it does migrate from dried paint. The element copper migrates very easily from plaster, see below table 8.

<i>Element</i>	<i>unit</i>	<i>total content in mg/kg</i>	<i>migration in mg/kg</i>	<i>%migration</i>	<i>category</i>
Antimony	mg/kg	750	180	24%	3
Arsenic	mg/kg	6	4	67%	1
Arsenic	mg/kg	17	7	41%	3
Cadmium	mg/kg	275	265	96%	3
Chromium	mg/kg	25000	10	0.04%	1
Chromium	mg/kg	800	210	26%	3
Copper	mg/kg	1440	1550	108%	1
Lead	mg/kg	75	52	69%	1
Lead	mg/kg	400	320	80%	3

Table 8: migration percentages per element for the samples evaluated in this PT

The reported test results will in practice be compared to the requirements for toys according to EN71-3:2013 (category I for plaster sample #16555 and category III for paper sample #16556 and for dried paint sample #16557), which supports essential requirements of EU Directive 2009/48/EC (no longer mentioning analytical corrections to be applied before reporting), see table 9. When this is done with the test results as reported in this proficiency test, the following is observed.

Plaster sample #16555 would be rejected by all laboratories for copper and lead, with the exception of laboratories 2118, 2254 and 3191 that reported a copper result below the maximum migration limit of 622.5 mg/kg.

Sample #16555 would be accepted by all laboratories for aluminium, chromium, manganese and strontium. However, laboratory 3220 would have rejected this sample because it reported an aluminium concentration above the maximum migration limit of 5625 mg/kg. For arsenic no consensus was found because 40 laboratories detected >3.8 mg/kg arsenic and would reject the sample, while 34 laboratories detected <3.8 mg/kg arsenic and would accept the sample.

Paper sample #16556 would be accepted by all laboratories as no laboratory reported arsenic above the maximum migration limit of 47 mg/kg.

Dried paint sample #16557 would be rejected by all laboratories for lead except for laboratories 551, 622, 2115, 2118, 2129, 2131, 2139, 2236, 2240, 2254, 2294, 2303, 2370, 2413, 2468, 2492, 2590, 2659, 3124, 3182, 3191, 3220 and 3238 that reported a lead concentration below the maximum migration limit of 160 mg/kg.

Sample #16557 would be accepted by all laboratories for aluminium, antimony, cadmium, chromium, manganese and strontium, except for laboratory 3220 (for Al) and laboratory 2489 (for Sb).

The maximum migration limits according to EN71-3:2013 are given in table 9.

<i>Element</i>	Migration limits for dry, brittle, powder like materials in mg/kg	Migration limits for scraped off materials in mg/kg
Aluminium	5625	70000
Antimony	45	560
Arsenic	3.8	47
Barium	1500	18750
Boron	1200	15000
Cadmium	1.3	17
Chromium III	37.5	460
Chromium VI	0.02	0.2
Cobalt	10.5	130
Copper	622.5	7700
Lead	13.5	160
Manganese	1200	15000
Mercury	7.5	94
Nickel	75	930
Selenium	37.5	460
Strontium	4500	56000
Tin	15000	180000
Organic Tin	0.9	12
Zinc	3750	46000

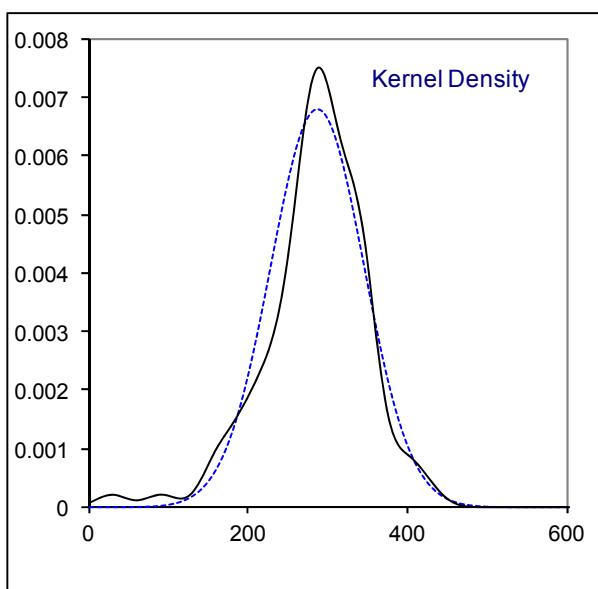

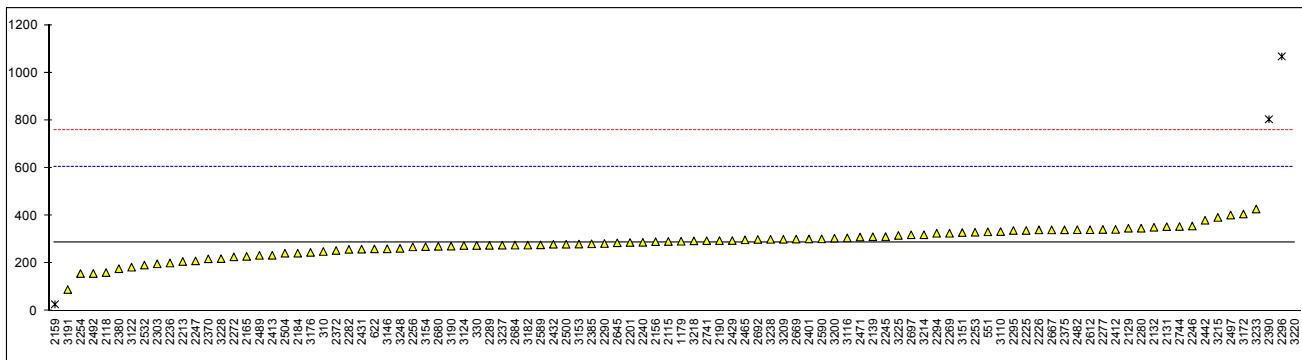

Table 9: maximum migration limits in EU according EN71-3:2013 and 2009/48/EN

Lab 2156 first reported for Nickel: 0.730 and for Zinc: 4.784

Lab 2272 first reported for Tin: 42.8

Lab 2442 first reported for Zinc: 388.8

APPENDIX 2**Details as reported by the participants**

lab	mg dried paint	ml 0.07 M HCl	pH adjusted	pore size filter	centrifuge used	remarks
310	246.1	12.5	YES	0.45	YES

APPENDIX 3

Number of participants per country

2 labs in BANGLADESH

1 lab in BELGIUM

1 lab in BRAZIL

1 lab in DENMARK

5 labs in FRANCE

7 labs in GERMANY

1 lab in GUATEMALA

10 labs in HONG KONG

5 labs in INDIA

3 labs in INDONESIA

4 labs in ITALY

1 lab in KOREA

3 labs in MALAYSIA

4 labs in MEXICO

42 labs in P.R. of CHINA

2 labs in PAKISTAN

1 lab in PHILIPPINES

1 lab in SINGAPORE

1 lab in SPAIN

1 lab in SRI LANKA

1 lab in SWITZERLAND

3 labs in TAIWAN R.O.C.

3 labs in THAILAND

2 labs in THE NETHERLANDS

7 labs in TURKEY

3 labs in U.S.A.

3 labs in UNITED KINGDOM

2 labs in VIETNAM

APPENDIX 4

Abbreviations:

C	= final result after checking of first reported suspect result
D(0.01)	= outlier in Dixon's outlier test
D(0.05)	= straggler in Dixon's outlier test
G(0.01)	= outlier in Grubbs' outlier test
G(0.05)	= straggler in Grubbs' outlier test
DG(0.01)	= outlier in Double Grubbs' outlier test
DG(0.05)	= straggler in Double Grubbs' outlier test
R(0.01)	= outlier in Rosner' outlier test
R(0.05)	= straggler in Rosner' outlier test
n.a.	= not applicable
n.d.	= not detected
fr.	= first reported result
